

Vacuum cleaner suction gauge, check the most important function of the vacuum cleaner!

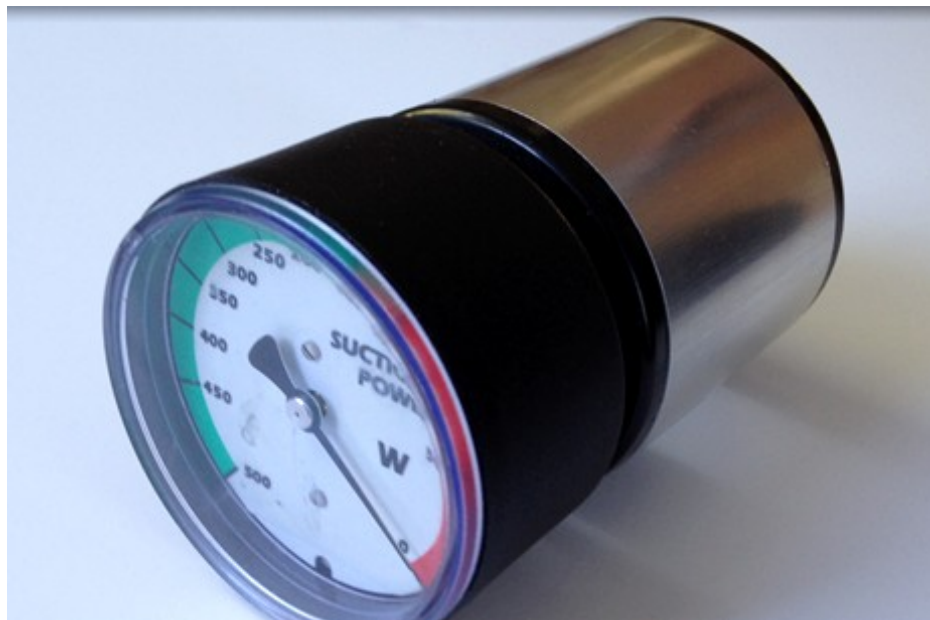

RESERVO AB — *Vacuum cleaner technique since 1983!*

All vacuum cleaners sold in the stores are marked with a label rated power which not is the suction power. The relationship between the label rated power and the suction power is that the label rated power indicates an approximated power consumption while the suction power is the power available in the vacuum cleaner airflow. The vacuum cleaner main function is the measurable suction power in Watt, not the label rated power.

For more information about the suction power and new EU-rules see our website, www.reservo.se

Use our vacuum cleaner suction gauge - VACCESS 04 - and confirm the accurate suction power of the vacuum cleaner!

AREAS OF APPLICATION:

BUYERS, SHOPS AND REPRESENTATIVES:

Compare suction power between different models to evaluate price against performance which also contributes to interesting dialogues with customers.

CLEANING COMPANIES:

Check the suction power and see the difference before and after changing bags and filters which are often the cause of the weak suction power. Check also the need of replacement of the hose and the pipe if they are the reason of a not sufficient suction power. See the difference between an old and a new vacuum cleaner.
